HPE NONSTOP FAMILY OF SYSTEMS

In a world that never stops, many enterprises absolutely can’t afford to be unavailable—for any reason. That’s where the unique value of NonStop comes in, with fully integrated, fault-tolerant systems delivering the highest availability, massive scalability, and operational efficiency. And, now offering the flexibility and choice of an unparalleled family of systems. HPE NonStop for industries that never stop.

ENGINEERED FOR THE HIGHEST AVAILABILITY LEVEL

In this mission-critical environment, business processing, online transaction processing (OLTP), and enterprise databases are the most-critical workloads to ongoing success—and are driving the need for workload-optimized, proven technology that can deliver continuous business and lower risk.

When availability matters, it’s time for a new compute approach.

HPE NonStop is designed specifically for the very highest availability level. According to the IDC Availability Level 4 definition, that means business processes continue as before.

“AL4 defines true fault tolerance, enabling continuous data processing, even in the event of the failure of one hardware or software component. The end user experiences no perceived interruption based on the use of fault-tolerant servers. In this level, the combination of multiple hardware and software components allow a near-instantaneous failover to alternate resources so that business processing continues as before without interruption.”

“HPE NonStop has never failed us. Our entire payment factory runs on it. Everything about NonStop, from the hardware tooling to the OS and database, is built to make sure no transaction can be lost. That is very important for protecting the good name of our bank and keeping the confidence of our customers.”

– Fred Böcker, Product Owner for HPE NonStop, Rabobank

1 IDC, Worldwide and U.S. High-Availability Server 2018–2021 Forecast and Analysis, Doc #43503817
2 IDC, Doc #43503817, September 2018 (see footnote 1)
AL4 DEFINES FULLY FAULT-TOLERANT SERVERS

“In this level, the combination of multiple hardware and software components allows a near-instantaneous failover to alternate hardware/software resources so that business processing continues as before without interruption.”

- Kuba Stolarski, IDC Enterprise Platforms

That means no interruption of work, no transactions lost, and no degradation in performance. For nearly four decades, the HPE NonStop architecture remains the ideal choice when there’s a need for the highest level of availability and reliability—in compute environments that require continuous business.

FULLY VIRTUALIZED INTEGRATED STACK

The HPE NonStop technology delivers true business resiliency with a highly integrated stack of hardware, software, database, and application services—providing the foundation that HPE NonStop mission-critical customers continue to rely on.

• **Continuous availability**—delivering instant, continuous access to secure, accurate data
• **Extremely low TCO**—reducing operating costs, and gaining on loss of downtime
• **Real-time database**—handling high-volume transaction processing and data warehouse environments
• **Data integrity**—ensuring transaction integrity and reliable handling of data
• **Massive scalability**—enabling near-linear scaling without degradation
• **Standard and modern**—leveraging the economies of standards-based, modular computing, and modern software development environments
• **End-to-end security**—providing sophisticated protection of resources and data

HPE NonStop systems are architected with built-in clustering, workload balancing, and online management to deliver continuous application availability and meet the most stringent uptime SLAs. HPE NonStop systems scale up to 16 NonStop CPUs within a single system (node), each running its own copy of the NonStop OS, and scale out to 4,080 NonStop CPUs on 255 networked NonStop nodes. These capabilities enable an environment that pools and optimizes all resources at the application level. Processing capacity, storage, and network resources are shared transparently to the end user.

The proven reliability, and virtually unlimited scalability of HPE NonStop is enabled by the NonStop Operating System, which combines the scalability of shared-nothing, massively parallel processing with industry-leading application availability, uncompromising data integrity, and support for key industry standard application programming interfaces (APIs) and services. It is this tightly integrated hardware and software architecture, combining hardware fault tolerance and software process-pair fault tolerance that delivers the very highest availability level.
ARCHITECTURAL CHOICE WITHOUT COMPROMISE

For decades, enterprises have trusted NonStop systems to power mission-critical 24x7 solutions, recognizing the distinct advantages of unmatched continuous availability and scalability. And now, HPE is offering the flexibility and choice of an unparalleled portfolio of HPE NonStop fault-tolerant systems for high-value business workloads and customer-facing applications—each with the same NonStop fundamentals.

Extending the HPE NonStop brand

The HPE NonStop product family of factory-integrated, fully tested, and verified hardware and software systems can be deployed on either the Intel Xeon processors of the current HPE NonStop X platform, or the Intel Itanium architecture of the renamed HPE Integrity NonStop i platform (soon to be discontinued). HPE has extended the mission-critical NonStop solution to include a virtualized solution that can be deployed in a private cloud environment. This HPE Virtualized NonStop is managed through VMware® based solutions and can be deployed on many industry standard x86-based servers. This software-based solution increases your choice of NonStop systems from the fully integrated and tested NonStop converged systems to VMware based virtualized IT platform as a service depending on what best suits your specific needs.

The addition of Virtualized NonStop provides current NonStop customers with the flexibility to confidently make continued investments in their current NonStop infrastructure, with an option to move to a software defined, private cloud environment whenever they are ready. Whatever your NonStop deployment choices are, you will benefit from the HPE NonStop fundamentals of availability, scalability, security, and data integrity for your mission-critical workloads.

HPE NONSTOP X SYSTEMS AT-A-GLANCE

Ultra-robust systems that deliver 24x7 continuous availability, unrivaled data integrity, and the capacity to handle the most-demanding processing-intensive workloads.

HPE VIRTUALIZED NONSTOP

HPE Virtualized NonStop delivers NonStop software (O/S, database, clustering, security) managed in a VMware environment using HPE or third-party x86 servers. It reflects the continuing innovation and “always adapting” NonStop solution portfolio to keep customers at forefront of technology to fulfill business objectives as needs change. HPE Virtualized NonStop (vNS) allows customers to host NonStop solutions within their enterprise’s software-defined data center (SDDC), virtualized and managed through VMware vRealize® Orchestrator™. Virtualized NonStop systems can be deployed on Infrastructure as a Service (IaaS) built using industry standard servers, storage, and networking products from your choice of vendors. The full suite of NonStop X software products runs on vNS. Applications built for the NonStop X (TNS/X) architecture need no modifications or recompilation to run on Virtualized NonStop, and hence offers great compatibility and easy, flexible movement between architectures, depending on where you want to place your NonStop workload.

For a complete and up-to-date description of the IaaS requirements and how to deploy and manage on VMware, refer to the document “Hardware architecture guide for HPE Virtualized NonStop on VMware” available here.
NEW POSSIBILITIES: HPE NONSTOP X

The NonStop X family, offered with the L-series version of the NonStop OS, extends the 100% fault-tolerant HPE NonStop platform to include the x86 architecture while delivering the same high level of availability, massive scalability, data integrity and low total cost of ownership (TCO). The HPE NonStop X systems are powered by Intel Xeon processors and are built upon an industry-standard InfiniBand system interconnect that provides up to 56 Gbps bidirectional-bandwidth for extreme scalability, fabric flexibility, high throughput, and low latency.

HPE NonStop X NS7

Representing the high-end of the HPE NonStop X family, the HPE NonStop X NS7 offers 2, 4 or 6-core software licensing options with more than double the performance capacity licensed at 6 cores when compared to the HPE Integrity NonStop BladeSystem NB56000c licensed at 4 cores. The NS7 combines the economies of newly enhanced standards-based, modular computing with the trusted 24x7 fault-tolerant availability and data integrity of the HPE NonStop architecture. The continuous availability, manageability, and development features of NonStop result in a low total cost of ownership (TCO) for hosting mission-critical applications. This applies equally to all generations of the NS7 including the NS7 X1, X2, and X3. On-line migration from NS7 X1 or NS7 X2, to NS7 X3 is supported.

Powered by Intel Xeon processors

HPE NonStop X NS7, built on proven HPE ProLiant BL460c server blades, is powered by Intel Xeon microprocessors and with the latest NS7 X3 version supporting up to 256 GB of memory per NonStop CPU, with single system (node) maximum memory capacity of 4 TB. The use of half-height server blades connected by InfiniBand enables the NS7 to double the NonStop CPU density within a single c7000 enclosure.

InfiniBand for a 25-time increase in system interconnect capacity

At the heart of the NS7 is a system interconnect based upon industry standard InfiniBand. The NS7 leverages the modular efficiencies of the industry-leading HPE BladeSystem c7000 Platinum Enclosure with 4X FDR (Fourteen Data Rate) InfiniBand double-wide switches to create the foundation for the NS7 system interconnect with a dual fault-tolerant switched fabric.

The NS7 with the Cluster I/O Modules (CLIMs) provides significant I/O configuration flexibility with IP and Telco CLIMs for communications support and the Storage CLIM, which serves as a controller to attach hard disk drives (HDDs), solid state drives (SSDs), HPE enterprise storage disk arrays, and tapes.

“With NonStop X based on the Intel Xeon processor, we will be able to continue growing and expanding our billing application with no concern about performance, capacity, or stability.”

– Bernard Dellicour, Infrastructure Manager, Proximus
HPE NonStop X NS3

The NS3 system is the NonStop entry-class system. Available with two or four NonStop CPUs, the NS3 provides the flexibility to choose either 1 or 2-core software licensing per NonStop CPU. Built to take advantage of the same InfiniBand double-wide switches for the system interconnect as the high-end NonStop X systems and powered by Intel Xeon processors, the NS3 supports up to 64 GB of memory per NonStop CPU. NS3 also undergone 3 generation of system evolution with the current one as NS3 X3, and online migration from NS3 X1 or NS3 X2, to NS3 X3 is supported. It uses c7000 enclosure configured for half-height blades, and with 4X FDR InfiniBand system interconnect, provides 56 Gbps raw bandwidth.

Providing uninterrupted access to information and services

The NS3 system can be configured with two or four NonStop CPUs in a factory-integrated, fully-tested and verified configuration and provides significant I/O configuration flexibility via Ethernet with Entry-class IP Cluster I/O Modules (CLIMs) or with Entry-class Telco CLIMs which support M3UA, Diameter, and Session Initiation Protocol (SIP) protocols. Disk storage is managed by Entry-class Storage CLIMs. These powerful I/O adapters provide evenly matched performance for the NS3 platform as they decrease the load on the host processor to balance overall performance and shorten response times.

The advantage of the NonStop software stack

HPE NonStop systems have been designed from day one with an integrated software stack that supports fault tolerance. These are delivered to customers as a fully tested and verified hardware and software solution for out-of-the-box efficiency. The NonStop software stack includes the NonStop OS and the OSS file system, security, system management, middleware, Java and Java-frameworks, a modern development environment, and one of the most scalable fault-tolerant databases in the world.

The HPE NonStop X is offered with the L-series version of the NonStop Operating System. The NonStop X software stack has been optimized to take advantage of the x86 architecture and use InfiniBand technology to improve software performance throughout the system. Security and time synchronization software are included with the NonStop OS.

HPE NonStop SQL/MX and SQL/MP database products are both available on NonStop X with all the latest features for massive scalability. Middleware products are available, as are Java and Java-related frameworks. The NonStop Development Environment for Eclipse (NSDEE) and compilers are enhanced with x86 architecture in mind. If you are new to NonStop you may find the NonStop Eclipse development environment friendly and familiar to your application development efforts on other platforms. NonStop is also taking great strides in the area of application modernization with DevOps. Innovating on the platform is now as flexible and easy as any modern IT platform in your data center since modern DevOps tools such as Git, Ansible and Jenkins can be used to develop applications on NonStop.

Running existing NonStop applications on NonStop X

Most existing non-native TNS (Tandem NonStop CISC) applications will run on the NonStop X architecture without change and can be accelerated to take advantage of the new system's performance using the new NonStop X accelerator. Native Intel Itanium applications can take advantage of the new NonStop X compilers and with a simple recompilation, run on the new platform, requiring few, if any source code changes.

NonStop X is a high-performance environment that fits comfortably into your existing data center, is ready for your mission-critical applications, and is 100 percent NonStop.
HPE INTEGRITY NONSTOP I SYSTEMS AT-A-GLANCE

Ultra-robust systems that deliver 24x7 continuous availability, unrivaled data integrity, and the capacity to handle the most-demanding processing-intensive workloads. With the end of life of Itanium processors from Intel, these systems are discontinued and are no more offered for sale. Specifically, the NS2300 and NS2400 systems are EOS since 31 October 2019. The NB56000c and NB56000c-cg systems will go EOS on 31 July 2020. HPE plans to offer support for these products for a minimum of five years after the published last sale dates of these products.

HPE NONSTOP CLUSTERS

Massive scalability
HPE NonStop systems are well-known for extreme scaling, easily handling bursts of transaction processing, end-of-quarter application loads, business changes such as mergers and acquisitions that require expansion in capacity, or adding a large number of customers in a short period of time.

NonStop X Cluster Solution
HPE NonStop X Cluster Solution (NSXCS) is a combination of clustering hardware and associated software that makes it easy to cluster multiple NonStop X NS7 systems (nodes) together in a tight interconnection using InfiniBand technology.

- Up to 24 nodes in one, two or three zones utilizing a pair of HPE NonStop 4X FDR InfiniBand Cluster Switches per zone, providing up to 56 Gbps bidirectional bandwidth.
- Up to 30 meters node to switch or switch to switch, up to 60 meters between nodes in the same zone and 90 meters maximum distance between nodes interconnected via any two zones.
- Up to 16 NonStop X CPUs per node, enabling a single cluster of up to 384 NonStop X CPUs.

Expand-over-IP networking
All HPE NonStop systems support Expand-over-IP networking, using high-speed Gigabit Ethernet links to interconnect multiple NonStop systems over a local or wide area network.

- Up to 255 NonStop systems (nodes), with up to 4,080 NonStop CPUs either co-located or geographically distributed for disaster tolerance.
**HPE NONSTOP SOFTWARE**

**Modern application development environment**
Integrated Development Environments (IDEs) make it easier for most developers to create and maintain application programs. With that in mind, HPE NonStop has invested in bringing these modern environments to the NonStop application community.

**Modern frameworks**
There are well over one hundred frameworks available to software developers, most of which are based on a specific language such as Java, C++, or JavaScript. Several of the most widely used open source and free Java frameworks make up the SASH stack, an acronym to describe a set of open source middleware that encourages application objects to be Plain Old Java Objects (POJO)—domain objects that only implement application specific logic.

- Apache MyFaces (presentation services)
- Axis2 (web services)
- Spring (business services)
- Hibernate (persistence services)

As a result, these open source frameworks have been widely adopted by Java developers, and in many cases have become the de facto technology for developing enterprise Java applications largely replacing EJB technology. HPE has tested and certified these frameworks for deployment on HPE NonStop. Sample programs, recommended configuration parameter values, and detailed user guides have been published. The Eclipse IDE has optional plug-ins to aid in Java development.

Framework-based applications are container agnostic. Applications can run on a lightweight web container like Tomcat or on a full-fledged Java EE application server like JBoss Application Server. This allows the choice of deployment server that is best suited for the server platform.

**Modern application development tools**
The NonStop build tools and compilers have been integrated into both the Microsoft Visual Studio with the Enterprise Toolkit (ETK) NonStop Edition and into Eclipse with NonStop Development Environment for Eclipse (NSDEE). These tools, including Certified Java SE Platform (JDK and JVM) and Apache Tomcat, help improve the productivity of new HPE NonStop developers. Many optional components and additional tools are available as plug-ins for each IDE.

**Middleware**
From a business perspective, the service-oriented architecture (SOA) model can help IT be more responsive to changing business needs, thereby improving business agility. HPE NonStop can play an important role in an SOA architecture as a first-class platform for the provision of SOA services.

Using the HPE NonStop system in this role brings the values of application and scalability, availability, data integrity, and ease of manageability to SOA services—without special programming.
“The HPE NonStop X fully meets our performance requirements. It has the capacity to perform processing at a level corresponding with our five-year transaction quantity estimates. Moreover, [it] offers a significant advantage of enabling the optimal utilization of resources and costs in line with business size and growth.”

– Shinji Sato, Administrative Management Department, Trust Networks

The HPE NonStop system SOA product technologies provide the necessary capabilities for service access, invocation, and implementation.

**HPE iTP WebServer**

HPE iTP WebServer software provides the HTTP and HTTPS protocol service for all the other SOA components. Built on the HPE NonStop Transaction Services/MP (NonStop TS/MP) infrastructure, iTP WebServer software provides a fault-tolerant and scalable container for web service execution, hosting both NonStop SOAP and NonStop Servlets for JSP components.

**HPE NonStop SOAP**

HPE NonStop SOAP software supports the standard SOAP 1.2 protocol. The combination of iTP WebServer and NonStop SOAP software provides the standard SOAP over HTTP protocol for invoking SOA services on the HPE NonStop system. NonStop SOAP is built on HPE NonStop TS/MP infrastructure and is fault tolerant and scalable.

**HPE NonStop Application Server for Java**

The HPE NonStop Application Server for Java (NSASJ) includes the Enterprise JavaBeans (EJB) Container and the web container modules of the JBoss AS. The built-in capabilities of Enterprise JavaBeans enable developers to concentrate solely on their business logic, rather than worry about platform dependence and related functionalities such as transaction integrity, data persistence, and availability. NSASJ is designed as an HPE NonStop Transaction Services/Massively Parallel (TS/MP) serverclass. Because it is a serverclass, NSASJ is continuously available and offers near-linear scalability on the HPE NonStop system.

**HPE NonStop Servlets for JavaServer Pages (JSP)**

HPE NonStop Servlets for JSP software is a fortified version of the Apache Tomcat web container that exhibits NonStop availability and scalability while supporting the standard Java Platform Enterprise Edition (JEE) Servlets and JSP programming models. NonStop Servlets for JSP software runs as a scalable serverclass using the iTP WebServer and NonStop TS/MP infrastructure. This integrated environment transparently inherits the scalability, reliability, and fault tolerance of the HPE NonStop system.

Open source Apache Axis2/Java software can be used in conjunction with the scalable NonStop Servlets for JSP container to implement either Java service adapters or Java SOA business processes. In addition, the JToolkit for NonStop Servers software enables easy access to Pathway servers and Enscribe flat file data from Java-based SOA services.

**HPE Pathway with NonStop TS/MP**

HPE Pathway with NonStop TS/MP software provides application server functionality that allows businesses to develop and deploy business-critical OLTP applications on HPE NonStop systems.

Using Pathway enables developers to concentrate on implementing their business logic without having to be concerned about common application services, such as load balancing, communications I/O, memory management, fault tolerance, and threading and scheduling. All these common services are provided by the Pathway application server software.
DATABASE AND TRANSACTION MANAGEMENT

HPE NonStop SQL is the mainstream database product for the HPE NonStop systems. NonStop SQL has been fundamentally architected as a clustered database system. It is designed to leverage the HPE NonStop tightly integrated, shared-nothing, massively parallel platform architecture and deploys the fault-tolerant model for immediate and transparent takeover for unparalleled reliability, availability, and scalability. It supports management of massive, multi-terabyte databases as a single database image and delivers high performance in a cluster environment. HPE NonStop SQL provides:

• **Outstanding scalability**—As the size of data volume, number of concurrent users or sessions, and query workloads and complexity for your database grow, you can add more computing power to the NonStop cluster and increase throughput linearly at greater than 98 percent.¹

• **Continuous availability**—The NonStop platform and NonStop SQL provide out-of-the-box database and application availability. There is no complex configuration required to achieve true 24x7 availability. Routine database administration (DBA) tasks can be done online without requiring the database and application to be brought down.

• **Application portability**—NonStop SQL supports industry standards (ANSI SQL, JDBC, ODBC) as well as numerous extensions to support porting of database applications from other platforms. The SQL/MX db for NonStop X also supports database compatibility, which makes it easier to port applications with popular dbs to the NonStop X platform.

• **Automatic load balancing**—NonStop SQL offers query and data virtualization capabilities, enabling an environment that pools and optimizes all resources at the application level. With built-in clustering, automatic workload balancing, and online management, organizations using NonStop SQL can seamlessly accommodate rapid growth without adding labor costs, compromising on service levels, or causing user disruption.

• **Lower database administration costs**—NonStop SQL database is distributed among multiple nodes of a cluster and is presented to the DBA and users as a single, clustered database image. The DBA’s tasks are not daunting or time consuming and don’t require highly specialized skills, thus managing a clustered database is no different from managing a non-clustered environment.

“Our billing application is highly customized and built on NonStop SQL. Moreover, it is providing us with 100% uptime, so there was never a consideration about not continuing with NonStop.”

— Bernard Dellicour, Infrastructure Manager, Proximus

¹ Internal lab tests conducted by HPE NonStop Advanced Technology Center

The tight integration between the HPE NonStop SQL database management system and the HPE NonStop Operating System enables absolute control over a concurrent mixed-workload environment, making the NonStop SQL database unique in effectively handling all types of workloads executing concurrently across a potentially very large cluster. HPE NonStop OS plays a critical role in allocating processor, disk, and I/O resources in an environment where competing priorities have to be dynamically monitored and processes deemed to be of the highest priority need to be given precedence. Additionally, many key NonStop SQL database operations take place at the operating system level, which in turn leads to increased efficiencies that have a positive impact on very large database (VLDB) and real-time database performance.

The ANSI SQL-compliant HPE NonStop SQL database can be accessed using Open Database Connectivity (ODBC) 3.0 and Java Database Connectivity (JDBC) Type 4 interfaces from Microsoft Windows and Linux® platforms, and an on-platform JDBC Type 2 driver and Open System Services (OSS) ODBC/MX driver. There are more recent enhancements as well. The drivers and ODBC server provide a highly reliable, 24x7 available and scalable connectivity solution that is standards-compliant and engineered for high performance and throughput, and well integrated with HPE NonStop database servers.
Transaction management

To ensure database integrity, the HPE NonStop Operating System integrates closely with HPE NonStop Transaction Management Facility (NonStop TMF) software, which provides distributed two-phase commit protection for global database changes across all affected HPE NonStop systems.

HPE NonStop TMF software is designed to help protect a database from intentional or accidental damage. With NonStop TMF software, a failure in an application, system, or network component does not result in a corrupted database because of a partially completed database update. Before an update changes the database, an image of every affected record or row is captured in memory and written to an audit log. If any part of an update fails or is programmatically aborted, NonStop TMF software automatically backs out the change in its entirety, returning the database to its state just prior to the start of that change.

Disaster tolerance

HPE NonStop Remote Database Facility (NonStop RDF) software extends the HPE NonStop system’s legendary fault tolerance to disaster tolerance. By geographically dispersing HPE NonStop systems, NonStop RDF software allows critical applications to survive a total site failure without specialized programming.

Using the transaction log generated by HPE NonStop TMF software, database changes are instantaneously replicated to one or more target systems, no matter how many transactions per second your application generates. If a primary database becomes inaccessible for any reason, processing can continue using the backup database with minimal service disruption or data loss.

SIMPLIFIED MANAGEMENT AND CONTROL

With an eye toward improving TCO, HPE offers a comprehensive selection of manageability products and solutions that provide self-management capabilities that can be adapted to customer-specific environments. HPE NonStop is managed by HPE Systems Insight Manager (SIM), NonStop Essentials, HPE IT Performance Suite and other enterprise (e.g., Tivoli, Netcool, Unicenter, Patrol, etc.) and open source management solutions (Nagios, etc.) in heterogeneous enterprise environments. NonStop manageability products can be categorized as follows.

• HPE SIM-related products—HPE Insight Control for NonStop includes HPE SIM, HPE Insight Control Power Management, and NonStop Software Essentials. These products work together to provide an HPE SIM-based single-pane-of-glass management environment for customers. Additional SIM-related products include NonStop Cluster Essentials, NonStop Performance Essentials, NonStop I/O Essentials, and HPE Insight Remote Support Advanced.

• HPE IT Performance Suite—Products for IT strategy, planning and governance, application lifecycle management, IT operations, security intelligence, information management, and business analytics.

• Serviceability products—Onboard Administrator (OA), Integrated Lights-Out (iLO), Open System Management (OSM).

• HPE Web ViewPoint-based products—Web ViewPoint, Pocket ViewPoint, Pathway plug-in, ASAP® plug-in, Storage Analyzer plug-in, Event Analyzer plug-in.

• Performance Management Bundle—Measure, Guardian Performance Analyzer (GPA), ViewSys, NonStop Performance Data Collector (PDC), Open Database, Data Browser, NonStop Performance Reporter (NPR), Disk Prospector (DiskPro), System Performance Analyzer (SPA), Pathway View.

• Other manageability products—ASAP, RPM, TimeSync Reload Analyzer (TRA) Enform Optimizer, TCM, Nagios.

HPE NonStop Essentials

HPE NonStop Essentials plug-ins provide integration between HPE Systems Insight Manager and HPE NonStop. HPE NonStop Cluster Essentials provides the management solution for both homogeneous clusters of HPE NonStop systems and heterogeneous clusters of NonStop and Linux systems. It provides integrated solutions for health monitoring, alert monitoring, event monitoring, integrated provisioning, virtualized configuration and control, unified account management, and software consistency checks.
HPE Systems Insight Manager (HPE SIM)

HPE SIM unifies the management of servers, storage, and networking devices. It gives customers a single tool for managing virtual and physical infrastructures. HPE Systems Insight Manager builds on field-proven technology that supports Microsoft Windows, Linux, and UNIX® operating systems and provides virtualization and automation capabilities, with plug-ins that complement and extend management solutions for HPE NonStop systems.

Compliance

HPE is committed to helping customers achieve and demonstrate security compliance on their HPE NonStop systems. To achieve this, HPE offers two products specifically targeted to help customers with security auditing and compliance.

XYGATE Compliance PRO allows enterprises to analyze and establish appropriate security settings on their system in order to close security vulnerabilities and deploy best security practices on the system.

XYGATE Merged Audit allows enterprises to consolidate event logs and enables real-time reporting and alerting about security events that have occurred. These NonStop security events can be integrated with HPE ArcSight SIEM using XYGATE Merged Audit. Use of HPE ArcSight SIEM allows businesses to view all security events across their entire enterprise from a single interface.

HPE NonStop Performance Essentials seamlessly integrates with HPE NonStop Cluster Essentials to provide real-time, as well as trend-monitoring, solutions for both homogeneous clusters of HPE NonStop systems and heterogeneous clusters of NonStop and Linux systems.

NonStop I/O Essentials provides the management solution for managing the I/O subsystem of HPE NonStop systems—reducing training costs and operator-induced errors.

NonStop Software Essentials is a software installation and management tool for all NonStop systems. It modernizes NonStop software management and is an HPE SIM plug-in that assists in planning, configuring, and installing HPE, third-party, and customer-developed NonStop software packages.

HPE IT Performance Suite

HPE IT Performance Suite is an open, modular platform designed to enable integrated continuous lifecycle management that automates and optimizes planning, delivery, deployment, performance, availability, and security. It simplifies operation with a complete self-service environment that provisions and configures IaaS from public or private clouds and your middleware and applications stack.

HPE IT Performance Suite provides information lifecycle management solutions to help manage all information—structured and unstructured—and unified security layers that integrate with operations monitoring, executive views, and automated response to threats for complete security.

HPE NonStop is supported in key HPE IT Performance Suite products such as Application Lifecycle Management 11, ArcSight ESM, ArcSight Logger, Business Process Insight (BPI), Discovery and Dependency Mapping Advanced Addition (DDMA), Fortify Source Code Analyzer (SCA), Fortify Real-Time Analyzer (RTA), LoadRunner, Network Node Manager i (NNM), Operations Manager, Operations Manager i, Operations Orchestration (OO), Performance Center, Quality Center, Service Manager, SiteScope, Sprinter, Storage Essentials, TransactionVision (TV), and Universal CMDB (UCMDB).

SECURITY

In today's interconnected world, companies across all industries need to demonstrate that they maintain confidentiality, integrity, and availability—for both their customers' data and their own. Additionally, overlapping standards and regulations continue to emerge all over the world.

This change in the business environment has made HPE NonStop customers even more aware of security needs for their individual businesses, and more demanding of sophisticated protection for their resources and data. HPE is meeting this demand by investing in new products and product enhancements that provide the security capabilities customers need.

On-platform

On-platform security is focused on reducing insider data theft and misuse by identifying users, controlling their access to sensitive data and system resources, and tracking their activities on the system.

HPE Safeguard security software provides flexible authentication, authorization, and audit services based on a subject/object access control model that allows enterprises to appropriately restrict authenticated users' access to NonStop Guardian system resources. Optional XYGATE Access Control and XYGATE User Authentication products have been added to the HPE NonStop portfolio to extend Safeguard's capabilities and enhance on-platform security.

Data in motion

Customers also need options for ensuring that sensitive data is protected when it is being moved. The HPE NonStop system includes HPE NonStop SSH and HPE NonStop SSL bundled with the HPE NonStop Operating System to deliver end-to-end communications security, strong authentication, and auditing for system administration, file transfer, and applications connectivity.

Data at rest

Optionally, HPE offers HPE NonStop Volume Level Encryption, a fully integrated encryption solution for data at rest on disk and tape media for HPE NonStop multi-core systems. In addition, integration with HPE Enterprise Secure Key Manager provides high-availability encryption key generation and retrieval, and storage of millions of encryption keys, while helping to meet PCI/DSS requirements for key management.
VERTICAL APPLICATIONS

Many industries, such as financial services, telecommunications, manufacturing, and healthcare are leading the way in delivering a continuous business environment—and HPE NonStop is there at the heart of their business.

• Processing over 1.4 billion credit and debit cards with a charge volume of over $3.6 trillion USD
• Servicing over 600 million subscribers in advanced Telco network applications such as Home Location Register (HLR), Home Subscriber Server (HSS), and other network applications
• Powering mission-critical applications at the leading global manufacturers
• Supporting several of the world’s leading medical institutions

As the de facto platform for card processing and electronic funds transfer (EFT) in the financial services industry, HPE NonStop can quickly scale resources for real-time, high-volume transactions. Global financial services leaders have improved bottom-line results from the comprehensive HPE portfolio of technology-based and services-led solutions, including applications from HPE partners such as ACI, AIB, BPC, ECS, FIS, Lusis, Opsol, and OmniPayments.

HPE POINTEX SERVICES

HPE Pointnext Services leverages our strength in infrastructure, partner ecosystems, and the end-to-end lifecycle experience, to accelerate powerful, scalable IT solutions to provide you the assistance for faster time to value. HPE Pointnext Services provides a comprehensive portfolio including Advisory and Transformational, Professional, and Operational Services to help accelerate your digital transformation.

Operational Services

HPE Datacenter Care: HPE’s most comprehensive support solution tailored to meet your specific data center support requirements. It offers a wide choice of proactive and reactive service levels to cover requirements ranging from the most basic to the most business-critical environments. HPE Datacenter Care Service is designed to scale to any size and type of data center environment while providing a single point of contact for all your support needs for HPE as well as selected multivendor products.

HPE Critical Service: High-performance reactive and proactive support designed to minimize downtime. It offers an assigned support team, which includes an account support manager (ASM). This service offers access to the HPE Global NonStop Solution Center, 24x7 hardware and software support, six-hour call-to-repair commitment, enhanced parts inventory, and accelerated escalation management.

HPE Proactive 24: Provides proactive and reactive support delivered under the direction of an ASM. It offers 24x7 hardware support with four-hour on-site response, 24x7 software support with a two-hour response, and flexible call submittal.

HPE Foundation Care: Support for HPE servers, storage, networking hardware, and software to meet your availability requirements with a variety of coverage levels and response times.

Advisory & Transformation Services: HPE Pointnext Services designs the transformation and builds a road map tuned to your unique challenges including hybrid cloud, Workload and Application Migration, Big Data, and the Edge. Hewlett Packard Enterprise leverages proven architectures and blueprints, as well as integrates with partner products and solutions. We also engage the Professional and Operational Services teams as needed.

Professional Services: HPE Pointnext Services creates and integrates configurations that get the most out of software and hardware, and works with your preferred technologies to deliver the optimal solution. Services provided by the HPE Pointnext Services team, certified channel partners, or specialist delivery partners include installation and deployment services, mission-critical and technical services, and education services.

Training and education
Gain the skills you need with training and certification from HPE. With HPE NonStop training, you will accelerate your technology transition, improve operational performance, and get the best return on your HPE investment.

Our training is available when and where you need it, through flexible delivery options and a global training capability. More trainings and webinars can be found at: nonstop-academy.com

THE PLATFORM FOR CONTINUOUS BUSINESS

If you require support for high volumes of online transactions, continuous access to information, and rational infrastructure and operational costs, HPE NonStop can help you address these critical enterprise business issues.

• The confidence that your business will be continuously on
• The agility to quickly respond to ever-changing market and IT demands
• The ability to implement new business processes and keep pace with new initiatives
• The elimination of complexity and cost
• The protection of data and resources

The HPE NonStop platform offers so much that is new, and continues to provide the highest levels of availability and near-linear scalability of any server in today’s marketplace—with hardware, operating system, database, software, and applications packaged as part of a well-integrated stack.

For real-time processing of ATM or payment transactions, telecommunications service, follow-the-sun access to operational data, or on-demand health information, you can trust it will be available.
