Counter ransomware attacks to prevent data loss and downtime

Secure your data and restore quickly and simply with HPE data protection solutions

HPE StoreOnce Catalyst is a secure and simple solution that integrates with existing native application data protection tools and third-party backup and recovery software. HPE Recovery Manager Central (RMC) provides fast recovery and backups can be optionally copied to the cloud with HPE Cloud Bank Storage. The HPE data protection solution is:

- **Secure:** Prevent unauthorized access to data on disk
- **Fast:** Deliver on recovery point objective (RPO) and recovery time objective (RTO) with up to 15X faster restores than traditional data protection approaches¹
- **Simple:** Integrate with existing data protection technologies and streamline related tasks with a single management console

Ransomware attacks are on the rise

Ransomware dominates the world of IT security and is vastly different from today's traditional viruses and malware. Managed by well-funded criminal organizations with squads of full-time developers, ransomware has become a lucrative business for many.

The following statistics heighten the need for a solution that counters ransomware attacks:

- A company is hit by ransomware every 40 seconds.²
- 63% of organizations experienced an attempted ransomware attack in 2017, with 22% reporting these incidents occurred on a weekly basis.³
- At least 15% of businesses in the top 10 industry sectors have been attacked.⁴
- 71% of companies targeted by ransomware attacks have been infected.⁵
- Despite paying the ransom, one in five businesses never get back their files.⁶

Companies that become victims of these attacks suffer financially after paying the ransom itself, losing valuable IT time, and experiencing downtime of **mission-critical applications**. Furthermore, damage to company brand is inevitable after high-profile attacks, leading to loss of customer base and market share.

Data backup stores that are not isolated from the operating system are equally vulnerable to ransomware attacks. Lack of encryption invites malicious access to these stores. When restoring data from backups, fast recovery is critical in order to prevent negative business impact. In addition, any solution that blocks ransomware attacks must coexist with existing data protection technologies such as backup and recovery software, as well as backup appliances.

Data isolation effectively protects the data, but efficient data management requires additional technologies. Implementing the 3-2-1 data retention recommendation is critical. This practice involves creating at least three copies of data (one primary copy and two backups), storing two copies on at least two different types of media (for example, disk and tape), and keeping at least one copy off-site.

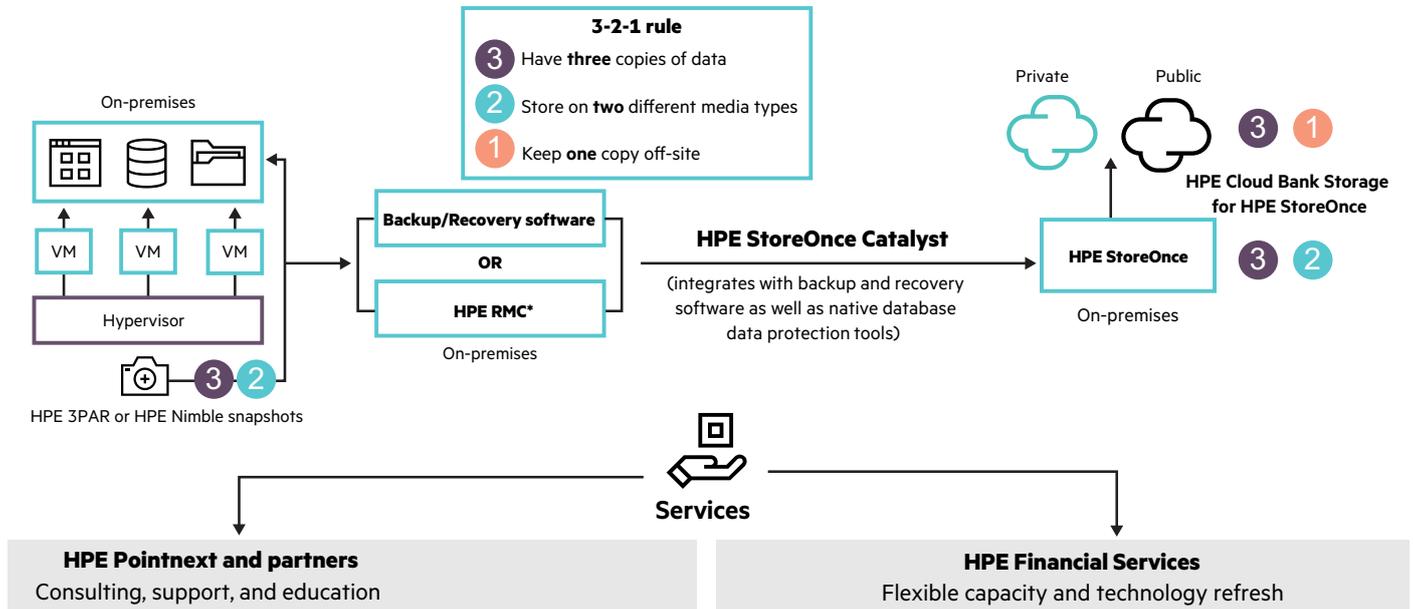

The HPE data protection solution includes **HPE StoreOnce Catalyst**, HPE RMC, and HPE Cloud Bank Storage. This solution secures your data from ransomware attacks while facilitating fast restores should the need arise—with the simple management of your data protection ecosystem.

Figure 1. HPE solution overview for data protection against ransomware

Increase data security

HPE StoreOnce Catalyst effectively isolates critical data so attackers cannot access it without resorting to direct physical interactions. Even in instances where physical destruction is achieved at a single location, federated HPE StoreOnce Catalyst stores protect mission-critical data by effectively isolating the data from traditional lines of communication and command sets leveraged by ransomware attackers. The HPE StoreOnce Catalyst store is hidden from attackers behind an application programming interface (API) that enhances and simplifies the process of backing up and deduplicating data. This makes it practically impossible for ransomware to attack backup stores directly.

Deliver on service-level agreements

Flash-enabled applications can take advantage of crash-consistent snapshots and backups with **HPE RMC** for the right data to be available for recovery at the right time. The HPE StoreOnce Catalyst store is the destination target for mission-critical data backed up by HPE RMC.

HPE RMC delivers efficient backup and recovery of data by using multiple block-based streams and sending only changed data blocks to HPE StoreOnce. Quick restores of data volumes enable meeting aggressive RPOs and RTOs after a ransomware attack.

Reduce data protection complexity

The HPE data protection solution integrates with existing native application data protection tools and third-party backup and recovery software, enabling simple management with the HPE 3PAR StoreServ Management Console (SSMC). The integration between HPE RMC and HPE 3PAR SSMC provides **HPE 3PAR StoreServ storage** administrators the ability to set up the HPE RMC protection policies through the HPE 3PAR SSMC GUI. The protection policies typically involve taking crash-consistent snapshots on the array. These policies can optionally include the ability to set up Express Protect backups to HPE StoreOnce and set up Catalyst Copies to a secondary HPE StoreOnce system. HPE RMC also allows restores from snapshots and backups or copies from within HPE 3PAR SSMC.

Faster recovery compared to traditional approaches

HPE Cloud Bank Storage for HPE StoreOnce lets you leverage the economics, agility, and flexibility of the cloud for modernized data protection. You can natively, securely, and cost-effectively move backup data to the public, private, or hybrid cloud—providing long-term retention and reliable disaster recovery that is simple and efficient. The solution sends, stores, and retrieves only unique data for lower total cost of investment (TCO). It is also highly scalable, enabling the protection and retention of more than 100 PB⁷ of backup data in your cloud of choice at one-tenth of a cent per month. In addition, it supports a broad ecosystem, cloud-enabling a wide variety of backup apps.

Leverage the expertise of HPE Pointnext

HPE Pointnext offers workshops and assessments that can help you identify and mitigate your risk by putting the right security and privacy controls in place, from user access through data protection for backup and continuity requirements. HPE Pointnext provides the following services:

- Advisory Services allow you to envision and define a road map for future success.
- Consumption-based IT with **HPE GreenLake** delivers unique pay-per-use solutions for your top workloads—Big Data, backup, database platform, SAP HANA®, and edge computing.
- Operational services offer new ways of delivering IT by managing and helping optimize workloads, resources, and capacity, both on-premises and in the cloud.

⁷ Assuming dedupe ratio of 20:1 and the maximum logical capacity of HPE StoreOnce 6600 of 34 PB.

⁸ HPE StoreOnce deduplication ratio from HPE internal lab tests has shown 20:1 reduction in data. The results are not typical and the number could vary based on number of factors including data change rate, backup retention, etc.

⁹ Actual results of data deduplication will vary with data type, change rates over time, and backup methodologies used.
